

SecureVault

File Explorer • Design System & UI Handoff

A dark-mode enterprise file explorer designed around secure navigation, deep folder structures, keyboard efficiency, and clear file inspection.

01 Primary Explorer Frame

Design intent. The primary frame establishes a focused workspace: the recursive explorer occupies the left side, while the properties area provides inspection context without leaving the current navigation state.

Visual reference: current SecureVault implementation supplied during the design review.

02 Explorer Interaction

The design supports deep navigation without page reloads. The breadcrumb communicates the user's full location, while the selected tree item and properties panel make the current context explicit.

Interaction	Expected visual behavior
Folder navigation	Expanded folders reveal children with a visible hierarchy line.
Selected item	Emerald-tinted background and border identify the active selection.
Breadcrumb	Full ancestral path remains visible as navigation context.
Properties	Selected item's name, type, identifier and size are surfaced on the right.

03 Design System

The following tokens define the visual language used by the SecureVault explorer. The system prioritizes readability, restrained contrast, and a precise security-oriented aesthetic.

Typography Scale

Token	Size	Line height	Use
Display	30 px	34 px	PDF / handoff title
Heading	21 px	25 px	Major section heading
Subheading	15 px	19 px	Component or section title
Body	11.5 px	17 px	Explanatory content
UI / Label	10–12 px	14–17 px	Explorer labels and metadata
Caption	9.5 px	13 px	Secondary annotations

Color Palette

App background		#060A1A
Explorer panel		#0F172A
Secondary panel		#111827
Border		#1E293B
Primary text		#E5E7EB
Secondary text		#94A3B8
Security accent		#10B981
Selected surface		#0F3D38

Spacing Grid

Base grid: 4 px. Common spacing steps are 4, 8, 12, 16, 24, 32, and 48 px. The grid is used for component padding, tree indentation, section gaps, and panel rhythm.

04 Component States

States are deliberately consistent so users can distinguish navigation, selection, keyboard focus, and search feedback at a glance.

Default Neutral slate surface; readable text; no emphasis.	Hover Subtle surface change communicates pointer affordance.
Focus Visible emerald focus ring supports keyboard navigation.	Selected Emerald-tinted surface + border identifies the selected item.
Expanded Folder icon and child hierarchy communicate open state.	Search active Search field receives clear focus and matching results remain visible.
Search empty Clear empty-result message prevents ambiguity.	

Design-to-Implementation Notes

The visual system is intentionally lightweight: custom React components and Tailwind utility classes provide the layout and states without Bootstrap, Material UI, Chakra UI, or Ant Design.

Accessibility: visible focus treatment, semantic tree roles, keyboard movement, and readable contrast are treated as part of the component design rather than as afterthoughts.

Scope note: the security status shown in the current application is explicitly labeled as a UI demo; it should not be interpreted as evidence of real encryption performed by this frontend.

Submission alignment

This handoff covers the assignment's required design-system deliverables: typography scale, color palette, spacing grid, and component states, while documenting the actual SecureVault explorer frames used by the implementation.
